SW can be patented as CII

EPO's definition

Index for Computer-Implemented Inventions

A computer-implemented invention (CII) is one which involves the use of a computer, computer network or other programmable apparatus, where one or more features are realised wholly or partly by means of a computer program.

The following collection of hyperlinks is provided in order to facilitate access to the sections of the Guidelines for Examination in the EPO which give instructions particularly useful for the search and examination of CII's.

It is noted that this collection is not a separate publication about CII's. Instead, following a hyperlink will lead to the section of the most recent and applicable version of the Guidelines which has the stated number and title.

A case study: Ermes Cyber Security

METHOD FOR UNSUPERVISED DETECTION OF WEB TRACKERS

ISP customers and corporate employees unwillingly expose sensitive information to tracking services. This methodology allows to automatically detect web services performing user tracking activity. By analyzing HTTP/S network traces generated by real users or bots, this unsupervised algorithm classifies tracking services to build blacklists to block them.

PRIORITY NUMBER:

102015000079272

KEYWORDS:

METHOD FOR UNSUPERVISED DETECTION OF WEB TRACKERS

DESCRIPTION:

Web tracking services, embedded in websites and portals, base their business on the collection of information about users browsing the Web. When a user visits website, her browser is induced to contact the embedded tracking services, which keep track of the visit and collect a variety of information (e.g., IP address, type of device, etc.). The user is monitored and tracked continuously during her browsing activity. Even corporates are potential targets of tracking services. In fact, they can rebuild corporate employees' activity and, collect information which tech corporate would likely protect. By inspecting traffic traces. The algorithm analyzes the key-value pairs contained in requests and identifies the keys whose values show a one-to-one mapping with the user. Keys exhibiting such behavior are labeled as tracking, as the services using them. With the output of the algorithm, we can build blacklists to install in browser plugins or firewalls, and prevent users and employees to contact trackers, thus preserving their privacy.

ADVANTAGES:

- Completely unsupervised;
- Personalized filter lists, built using specific user/corporate traffic log;
- No pre-built models or rules;
- Compatible with all platforms.

APPLICATIONS:

- Corporate data protection;
- Unsupervised filter creation to block malicious sites.

(54) Title: METHOD FOR DETECTING WEB TRACKING SERVICES

(57) Abstract: Method for detecting web tracking services during browsing activity performed by clients having associated client identifiers, the method comprising the steps of extracting key-value pairs contained into navigation data, looking for one-to-one correspondence between said client identifiers and the values contained in said keys and selecting the keys for which at least a client-value one-to-one correspondence for at least a predetermined number of clients is observed, said keys identifying the associated services as services performing tracking activities.
